---

Version 1.0.0 is now released. Some major changes will be included. The list below gives a bit of detail but some changes are already in place. For example Broadband-hamnet.org or Broadbandhamnet.org already bring up this site. HSMM-MESH.org will still work but the site will now answer to both. Other things to expect are:

- SSID changes to BroadbandHamnet-v1
  
- Upgrade ALL is necessary as SSID and the actual format of data flowing will be changing
- SSID minor level (v1) will increment when firmware requires another upgrade all
- Interoperability with Ubiquiti and other hand loaded systems (simple web page config for Ubiquiti comes later)
- DNS changes from the Austin.TX.mesh style to local.mesh
- Monthly developer meetings in Austin, known as Digital Wednesday, will soon be Webinars
- More FAQs to be written, better documentation on the way
- YouTube videos becoming more popular, see "videos" in left menu or search YouTube
- More mesh elmers have joined, more are needed
- Over 1950 registered users on the forums, rising by nearly 100/month
- Web site hits growing at an increasing pace, Google hits for hsmm mesh and Broadband-Hamnet search terms growing
- QST article was published in July with more to follow

Watch here or in the developers newsgroup for updates

73,

Rick, NG5V
